

Amazon runs on
mechanisms. You run
on *good intentions*.

That is the whole gap.

Good intentions don't work.
Mechanisms do.

AN OLD ADAGE AT AMAZON

When something broke, Bezos never asked *who messed up*.

He asked: do we have a mechanism in place so it doesn't happen again? People already had good intentions when the problem happened.

HIGH-VELOCITY DECISION MAKING

70%

OF THE INFORMATION YOU WISH YOU HAD

If you wait for 90%, in most cases, you're probably being slow. Being wrong may be less costly than you think, whereas being slow is going to be expensive for sure.

JEFF BEZOS, 2016 LETTER

Solo, your default dispute resolution is *exhaustion*.

Bezos wrote that without escalation, whoever has more stamina carries the decision. Working alone, both parties are you — and the winner is the anxious voice at midnight.

01 **Velocity**

Decide at 70%. Ten minutes on reversible calls.

02 **Single-thread**

Two open threads run at 35% each, not 50%.

03 **Re-entry**

Recover context in two minutes, not ninety.

04 **Input metrics**

Measure what you control, not MRR you can't move.

05 **Compounding**

Never solve the same problem twice.

```

Five mechanisms. Real state files. No advice.

You can't out-discipline
a team. You can *out-*
mechanism one.
